### Placebos without Deception: A Randomized Controlled Trial in Irritable Bowel Syndrome

Ted J. Kaptchuk<sup>1,2</sup>\*, Elizabeth Friedlander<sup>1</sup>, John M. Kelley<sup>3,4</sup>, M. Norma Sanchez<sup>1</sup>, Efi Kokkotou<sup>1</sup>, Joyce P. Singer<sup>2</sup>, Magda Kowalczykowski<sup>1</sup>, Franklin G. Miller<sup>5</sup>, Irving Kirsch<sup>6</sup>, Anthony J. Lembo<sup>1</sup>

### Open-label placebo vs double-blind placebo for irritable bowel syndrome: a randomized clinical trial

Anthony Lembo<sup>a,\*</sup>, John M. Kelley<sup>b,c</sup>, Judy Nee<sup>a</sup>, Sarah Ballou<sup>a</sup>, Johanna Iturrino<sup>a</sup>, Vivian Cheng<sup>a</sup>, Vikram Rangan<sup>a</sup>, Jesse Katon<sup>a</sup>, William Hirsch<sup>a</sup>, Irving Kirsch<sup>c</sup>, Kathryn Hall<sup>c,d</sup>, Roger B. Davis<sup>c,e</sup>, Ted J. Kaptchuk<sup>c,e</sup>

**IBS-SSS** 

#### Are They Side Effects? Non-specific Symptoms Reported At The End Of A Randomized Controlled Trial Are Often Present At Baseline

Rafla Hassan<sup>1</sup>, Sarah Ballou<sup>1</sup>, Vanessa Yu<sup>1</sup>, Vikram Rangan<sup>1</sup>, Nee, Judy<sup>1</sup> Johanna Iturrino<sup>1</sup>, Ted J. Kaptchuk<sup>1</sup>, Anthony Lembo<sup>1</sup> <sup>1</sup> Division of Gastroenterology, Department of Medicine, Beth Israel Deaconess Medical Center, Boston, MA, USA

- Adverse events (AEs) clinical trials often use open-ended questions to assess AEs
- This approach is not validated, is prone to bias, can underestimate the number of actual symptoms and does not account for symptoms present at baseline
- We aimed to evaluate now extraintestinal symptoms (EIS) change over time in a RCT
- 15 nonspecific EIS assessed baseline and end of study (week 6). Symptom burden: summing severity (0-5).
- 219 IBS patients (73% women)

<u>Conclusions:</u> Non-specific symptoms are common and usually more severe at baseline.

Commonly reported AEs should be assessed at baseline to better assess their relationship to treatment

## **Dietary Considerations for IBS**

- "Traditional IBS diet"
  - 3 meals and <3 snacks /day : do not over eat!</li>
  - Reduce fatty or spicy foods, coffee, alcohol, onions, cabbage and beans
  - Avoid soft drinks, chewing gum, sweeteners that ends in –ol
  - Soluble fibers intake evenly during the day
- Low-FODMAP
- Gluten Free

# **Gluten Free Diet for IBS: Clinical Trials**

	GFD	)	Con	trol		Risk ratio		F	lisk r	atio	
Study or subgroup	Events	Total	Events	Total	Weight	M-H, random, 95% Cl		M–H, ra	andor	m, 95% Cl	
Biesiekierski 2011	10	19	14	20	52.2%	0.75 (0.45, 1.26)			-		
Shahbazkhani 2015	6	37	26	35	47.8%	0.22 (0.10. 0.47)		-	-		
Total (95% CI)		56		55	100.0%	0.42 (0.11, 1.55)

			,				F	avors GFD	)	Favors con	trol

Patients who responded to a GFD randomized to continue GFD or receive diet "spiked" with gluten

#### There is insufficient evidence to recommend a GFD to reduce IBS symptoms

•

#### FODMAPs, but not Gluten, Elicit Modest Symptoms of IBS: Double-Blind, Placebo-Controlled, Randomised 3-way Crossover Trial

Per M. Hellström, Elise Nordin, Carl Brunius, Rikard Landberg

#### 110 IBS patients(96 women; all subtypes)

No difference in other components of IBS-SSS

Approximately 50% higher amounts than typical Swedish diet

### **Conclusions:**

Modest symptom increase with FODMAP, No significant increase with gluten

# What are FODMAPs?

- Fermentable oligo-, di-, monosaccharides and polyols
- Fruits with fructose exceeding glucose
  - Apples, pears, watermelon

### • Fructan containing vegetables

- Onions, leeks, asparagus, artichokes
- Wheat based products
  - Bread, pasta, cereal, cake, biscuits
- Sorbitol and lactose containing foods
- Raffinose containing foods
  - Legumes, lentils, cabbage, brussels sprouts

Eswaran & Chey, GI CI North Am 2011;40:141 Shepherd, et al, Clin Gastro Hepatol 2008;6:765 Gibson & Shepherd. J Gastro Hepatol 2010;25:252

### Differing Effects of FODMAPs in the GI Tract

Fructose distends the small bowel with water

Fructan distends the colon with gas

Common fructans

Wheat including bread, pasta, etc., onions,, garlic, barley, brussels sprouts, cabbage, broccoli,, artichoke, inulin

Murray et al. Am J Gastroenterol 2014 Jan;109(1):110-9

## **3 Phases of the Low-FODMAP Diet**

### Elimination

Diagnose FODMAP sensitivity

### Determine Sensitivities

Diversify the diet to improve adherence and reduce effects on the MB Personalize Find each patient's low FODMAP diet

Chey WD. Am J Gastroenterol 2016:111;366 Dolan R, et al. Exp Rev Gastroenterol Hepatol 2018;12:607

### Examples of Studies Assessing the Elimination Phase of the Low-FODMAP Diet in IBS

Halmos EP, et al. Gastroenterology. 2014;146:67-75.

Böhn L, et al. Gastroenterology. 2015. doi: 10.1053/j.gastro.2015.07.054.

### Low-FODMAP vs. mNICE Diet: IBS-D

No Differences between Low FODMAP and mNICE

Adequate Relief (>50% of the weeks) 52% vs. 41% (P=0.31)

Composite responders (abdominal pain and stool consistency) (P=0.13)

# P values refer to the change WITHIN group comparing to baseline score

### **RCTs Evaluating the Low-FODMAP Diet for IBS**

- 7 RCTs (n=397)
- Overall reduction in symptoms (RR 0.69; 95% CI 0.54, 0.88)
- RCTs comparing low FODMAP with control diets had the least magnitude of effect
- Overall quality of the data = "very low"
  - Most studies were high risk of bias
  - Heterogeneity between study designs
  - Imprecision in the estimate of effect

Dionne et al. Am J Gastroenterol 2018, online	early.

### How Do FODMAPs Cause IBS Symptoms?

# **JCI** The Journal of Clinical Investigation

FODMAP diet modulates visceral nociception by lipopolysaccharide-mediated intestinal inflammation and barrier dysfunction

Shi-Yi Zhou, ... , Yuanxu Lu, Chung Owyang

J Clin Invest. 2018;128(1):267-280. https://doi.org/10.1172/JCI92390.

### Mast Cell Activation Leading to Colonic Barrier Dysfucntion Following High FODMAP Diet is Mediated via Lipopolysaccharide

Prashant Singh, Gintautas Grabauskas, Shi-Yi Zhou, Yawen Zhang, Chung Owyang

### In the rodent Model:

High FODMAP causes intestinal barrier dysfunction through mast cell recruitment and activation

Mast cells are critical - mice deficient in Mast cells do not show intestinal barrier dysfunction to High FODMAP

#### In IBS-D, Iow-FODMAP improves: barrier dysfunction mast cell activation fecal LPS levels (Jm/gd) 6 20000-P=0.04 P=0.04 EU/m P=0.005 500-15000· TEER (Ohms.cm<sup>2</sup>) 400-300 Serum tryptase 10000 200 LPS 5000 100 -ecal IBS IBS+LFM Post-LFM IBS-D Post-LFM IBS-D

#### Low-FODMAP diet decreases mast cell activation via

# Limitations of the Low FODMAP Diet

- High level of restriction
- Difficult to follow (best done with an expert dietitian)
- Potential nutritional deficiencies (i.e, removes many 'healthy' foods such as fruits and vegetables)
- Significant gut microbiota reduction
- No current predictors of response

Does the low-FODMAP diet need to be so restrictive?

#### Are all FODMAPs created equal? A blinded, randomized reintroduction trial to determine which FODMAPs drive clinical response in IBS patients

Shanti Eswaran; Prashant Singh; Samara Rifkin; Theresa Han-Markey, William D Chey <sup>1</sup> Division of Gastroenterology, Department of Internal Medicine, Michigan Medicine

#### **Double-blind Food Challenge**

5 sequences over 7 days; 7 day washout 3 days of moderate FODMAP followed by 4 days higher FODMAP FOS 0.75 g/day -> 1.5 g/day fructose 10 g/day -> 21 g/day lactose 10 g/day -> 20 g/day sorbitol 5g/day -> 10g/day

#### 45 IBS patients (95% women; all subtypes)

- Blinded reintroduction of fructans and galactans was associated with worsening of abdominal pain and/or bloating.
- These findings suggest that all FODMAPs are not equal and opens the door to trials evaluating the clinical benefits of a simplified low FODMAP diet in IBS patients.

# Efficacy of a new approach to the reintroduction phase of the low-FODMAP diet in IBS patients

Karen Van den Houte, Esther Colomier, Zoë Mariën, Jolien Schol, Jasmien Van den Bergh, Julie Vanderstappen, Nelle Pauwels, Christophe Matthys, Tim Vanuytsel, Florencia Carbone, Jan Tack

# Sucrase-Isomaltase Deficiency (SID)

- Often occurs together since *Sucrase -isomaltase* is synthesized in the enterocyte as a single glycoprotein chain and, after insertion in the brush-border membrane, is cleaved by pancreatic proteases into sucrase and isomaltase
- Prevalence of deficiency is not well know
  - Primary deficiency is inherited as autosomal recessive (CSID)
    - Prevalence of CSID: estimated to 0.05% to 0.2%, higher in Greenland, Alaska and Canada up to 10%
  - Secondary deficiency of SID : not well studied
- One study 35% (11/31) of patients with undergoing EGD for an evaluation of chronic diarrhea and/or abdominal pain had a decrease in sucrase-isomaltase enzyme activity on duodenal biopsies

Kim S, et al Digestive Diseases and Sciences (2020) 65:534–540

### **CSID** Mutations are Associated with IBS

Two studies found CSID mutations more often in patients with IBS than controls

IBS	Controls			
22/1031 (2.1%)	10/856 (1.2%)			
88/2207 (4.0%)	928/33,370 (2.8%)			

A common SI variant (Val15Phe), which shows reduced enzymatic activity in vitro, is strongly associated with increased risk of IBS

Henström M, et al. Gut 2016;0:1–8. doi:10.1136/gutjnl-2016-312456 Garcia-Etxebarria, et al. Clin Gastroenterol Hepatol 2018;16:1673 Husein & Naim. Gut 2019, doi:10.1136/gutjnl-2019-319411

# Reduced efficacy of Low FODMAP diet in patients with SID

- 46 pts from US RCT randomized to LFD
- Primary endpoint: Adequate relief of IBS symptoms
- SI gene variants analyzed
- In a separate analysis the number of gene variants present predicted nonresponse to LFD or mNICE

Zheng et al. *Gut* 2020;**69:**397-398

#### Prevalence of Sucrase-Isomaltase Deficiency in adults with Irritable Bowel Syndrome and Diarrhea: An interim analysis from a prospective US trial

<u>SW Chey MPH</u><sup>1</sup>, SL Eswaran MD<sup>1</sup>, and WD Chey MD<sup>1</sup> <sup>1</sup> Division of Gastroenterology, Department of Internal Medicine, Michigan Medicine

MICHIGAN MEDICINE

 AIM: Determine prevalence of SID in IBS-D using diasaccharidase enzyme activity

#### Table 1. Demographics and Baseline of Study Participants

Characteristic	Study Population (n:58)	SID-positive Population (n: 5)	
Average Age (years)	42.6	48.6	
Gender - n (%)			
Female	43 (74)	3 (60)	
Male	15 (26)	2 (40)	
Race - n (%)			
White/Caucasian	54 (93)	5 (100)	
Black/African American	1 (2)	0	
Hispanic/Latino	1 (2)	0	
Asian	1 (2)	0	
Other	1 (2)	0	
Diagnosis - n (%)			
IBS-D	39 (67)	3 (60)	
Functional Diarrhea	19 (33)	2 (40)	
Average BMI (kg/m <sup>2</sup> )	30.4	26.5	
Treatment Naïve	29 (50)	0	

#### Figure 1. IBS-SSS Questionnaire\*\* Data for Study Population and Domains

#### **Conclusions:**

1. SID was present in 9% of adults with IBS-D or Functional Diarrhea

2. Demographics/symptoms similar in those with and without SID

#### Exhaled Hydrogen Sulfide is Increased in Patients with Diarrhea: Results of a Novel Collection and Breath Testing Device

Abdominal pain + Diarrhea	18.4±43.2	112.3±68.4	0.0001
Abdominal pain + Diarrhea + Urgency with bowel movement	30.3±67.9	175.9±87.3	<0.0001

A new gas collection system and novel 4-gas detection device was capable of measuring levels of H<sub>2</sub>, CH<sub>4</sub>, and H<sub>2</sub>S (in addition to CO<sub>2</sub>) in humans during clinical breath testing.

H<sub>2</sub>S of ≥5ppm during breath testing was associated with diarrhea, abdominal pain, and urgency during breath testing.

H<sub>2</sub>S was uncommonly found in patients with CH<sub>4</sub>.

A cutoff of 5ppm for H<sub>2</sub>S was the best predictor of diarrhea. However, normal subjects almost never exceeded 2 ppm of H<sub>2</sub>S.

#### Predictors of Health Care Utilization in Patients with Functional Bowel Disorders

Vanessa Yu<sup>1,2</sup>, Sarah Ballou<sup>1</sup>, Rafla Hassan<sup>1</sup>, Vikram Rangan<sup>1</sup>, Judy Nee<sup>1</sup>, Johanna Iturrino<sup>1</sup>, Anthony Lembo<sup>1</sup> <sup>1</sup> Division of Gastroenterology, Department of Medicine, Beth Israel Deaconess Medical Center, Boston, MA, USA <sup>2</sup> Tufts University School of Medicine, Boston, MA, USA

- Patients with disorders of gut-brain interactions are high utilizers of health care.
- Direct and indirect costs related to disorders of gut-brain interactions are estimated to be \$21.0 and \$37.4 billion, respectively.
- Previous health care utilization studies lacked patient-level predictors.

434 patients completed the health care utilization questionnaire and met the criteria for IBS, FC, or RD (mean age 44 years, 79.5% female, and 73.5% IBS).

Patient-Reported Outcomes Measurement Information System (PROMIS) standardized t-score. Higher scores more severe symptoms.

#### Table 4. Multivariate regressions

Linear regres	sion predicting GI o	outpatient utilizati	on
	β	SE	Р
Age	0.01	0.01	0.18
Sex	-0.16	0.33	0.63

F		6.12, <i>P</i> < 0	0.0001

#### Effect of Abdominal on ED Visits for GL symptoms

#### WHAT IS NEW HERE

- Abdominal pain was a primary predictor of health care utilization.
- Severity of depressive symptoms was also a strong predictor.
- Altered bowel habits did not predict health care utilization.

## **Eosinophilic Gastrointestinal Diseases**

Associated with activated eosinophils and mast cells

Eosinophilic GI disease are considered to rare however emerging evidence suggests that they may be more common

Symptoms are non-specific and overlaps with functional bowel disorders

Definition: Presence of > 30 eosinophils/hpf in at least five HPFs

Endoscopy and Systematic Biopsy of Patients with Chronic Gastrointestinal Symptoms Leads to High Discovery Rate of Patients Who Meet Histologic Criteria for Eosinophilic Gastritis and/or Eosinophilic Duodenitis
