

2023 SCSG LGI SYMPOSIUM

Improving Your Adenoma Detection Rate

Jennifer Phan, MD

Assistant Clinical Professor of Medicine
Interventional and Bariatric Endoscopy
Keck School of Medicine of USC

Disclosures

- Boston Scientific
- Olympus
- Cook Medical
- Noah Medical
- Intuitive Surgical

Outline

- Key Factors that affect ADR
 - Endoscopic Training
 - Patient-related Factors
 - Endoscopic Technique
 - Improved Navigation
 - Improved Visualization
 - Endoscopic Unit Support

Endoscopic Training

- Well documented that endoscopists undergoing educational interventions have the highest ADR
 - Tandem colonoscopy (reference standard): adenoma miss rate ~24%¹
 - Simple feedback

Study or subgroup	Feedback group		No Feedback group		Odds Ratio		Odds Ratio	
	Even	Odd	Events	Total	Events	Total	Weight	M-H, Random, 95% CI
1.8.1 Screening colonoscopies								
Barclay 2008	82	141	12	122	12	122	11.7%	1.71 [1.55, 1.87]
Gurudu 2018	39	31	12	31	216	602	7.5%	1.57 [1.23, 1.99]
Kahi 2013	31	78	39	105	14	100	1.8%	3.63 [1.82, 7.24]
Kaminski 2016	78	141	39	105	14	100	1.8%	3.63 [1.82, 7.24]
Keswani 2015	141	122	39	105	14	100	1.8%	3.63 [1.82, 7.24]
Otto 2010	12	31	39	105	14	100	1.8%	3.63 [1.82, 7.24]
Rajasekhar 2015	238	624	3643	8673	2319	7480	12.3%	1.61 [1.51, 1.72]
Subtotal (95% CI)			24197	62497	3209	10809	33.3%	1.67 [1.51, 1.84]
Total events	624	9349	3209					
Heterogeneity: Tau ² = 0.03; Chi ² = 6.17, df = 3 (P = 0.10); I ² = 51%								
Test for overall effect: Z = 10.01 (P < 0.00001)								
1.8.2 Screening and surveillance colonoscopies								
Abdul-Baki 2015	5424	14899	660	2627	11.7%	1.71 [1.55, 1.87]		
Coe 2013	243	520	216	602	7.5%	1.57 [1.23, 1.99]		
Nielsen 2017	39	105	14	100	1.8%	3.63 [1.82, 7.24]		
Wallace 2017	3643	8673	2319	7480	12.3%	1.61 [1.51, 1.72]		
Subtotal (95% CI)			10809	33309	33.3%	1.67 [1.51, 1.84]		
Heterogeneity: Tau ² = 0.00; Chi ² = 6.17, df = 3 (P = 0.10); I ² = 51%								
Test for overall effect: Z = 10.01 (P < 0.00001)

Patient-Related Factors

- Bowel preparation
 - Gold standard: split regimen of 3–4 liters polyethylene glycol (PEG)
 - Split regimen vs traditional day before prep: adenomas RR 1.26; sessile serrated lesions RR 2.48¹
 - High (3–4L) vs low (2L) volume: no difference in bowel prep (86% vs 87%) but higher pt adherence and completion²
 - Patient education regarding bowel preparation
 - 346 patients randomized
 - VR group had significantly higher:
 - ADR (32.6 vs 22.1%)
 - PDR (41.9 vs 26.7%)
 - Pt compliance
 - No difference in detection of SSA or cancer

E Solution of the loops

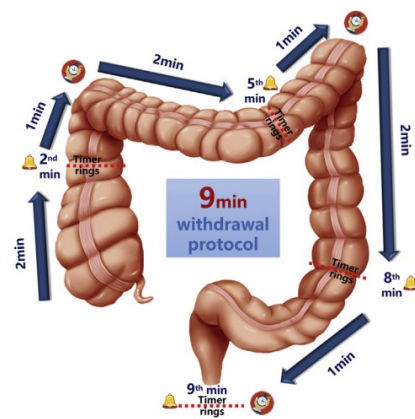

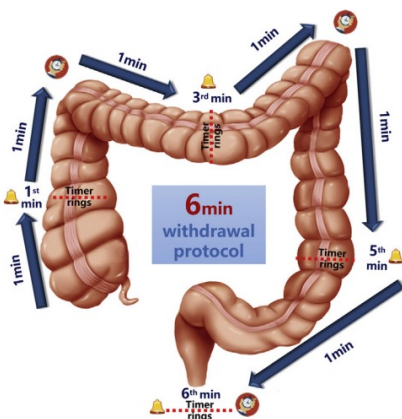

¹Zawaly et al. *AJG*. 2019; ²Spadaccini et al. *CGH*. 2020.

Endoscopic Technique

Low Cost Strategies

- Withdrawal Time
 - ASGE recommends at least 6 minute withdrawal

ADR: 27.1%
R colon: 7.6%
Flat/Sessile: 19.3%

36.6%
13.6%
27.4%

Endoscopic Technique

Low Cost Strategies

- Second look in the right colon
 - Any second look increases ADR 5-20%
 - 1011 patients randomized to second forward view (of R colon) vs standard single view¹
 - Prospective RCT with 45 endoscopists over 6 Asian Pacific regions
 - Right colon ADR significantly higher with second forward view (27.1% vs 21.6%)
 - SFV identified 58 additional adenomas in 45 patients (9.8%) → changes in surveillance in 15 patients (3%)

Endoscopic Technique

Low Cost Strategies

- Water-aided colonoscopy (exchange, immersion)
 - 1224 patients randomized: WE vs WI vs air insufflation

	WE	WI	Air	p-Value
Overall ADR	49.3% [44.3–54.2]	43.4% [38.5–48.3]	40.4% [35.6–45.3]	.03; >0.99
R colon ADR	24.0% [20.0–28.5]	19.1% [15.4–23.3]	16.9% [13.4–20.9]	.04; >0.99

Data strengthens the validity that water exchange, but no immersion, can achieve significantly higher ADR than air insufflation

Endoscopic Technique

Low Cost Strategies

- Goal: decrease blind spots
- Distal cap attachment: protects tissue during introduction and helps avoid “red out”
 - Data is controversial
 - Initial meta-analysis of >4600 patients showed improved ADR with cap¹
 - More recent RCTs showed no significant difference in ADR, proximal ADR, or SSA detection rate²
- EndoCuff Vision
 - ADR: RR 1.12 (1.02-1.23); $p = 0.02$ ³
 - No difference in SSL or proximal colon polyp detection rate

¹Nutalapati et al. *EIO*. 2018; ²Marsano et al. *EIO*. 2019; ³Patel et al. *GIE*. 2021.

Endoscopic Technique

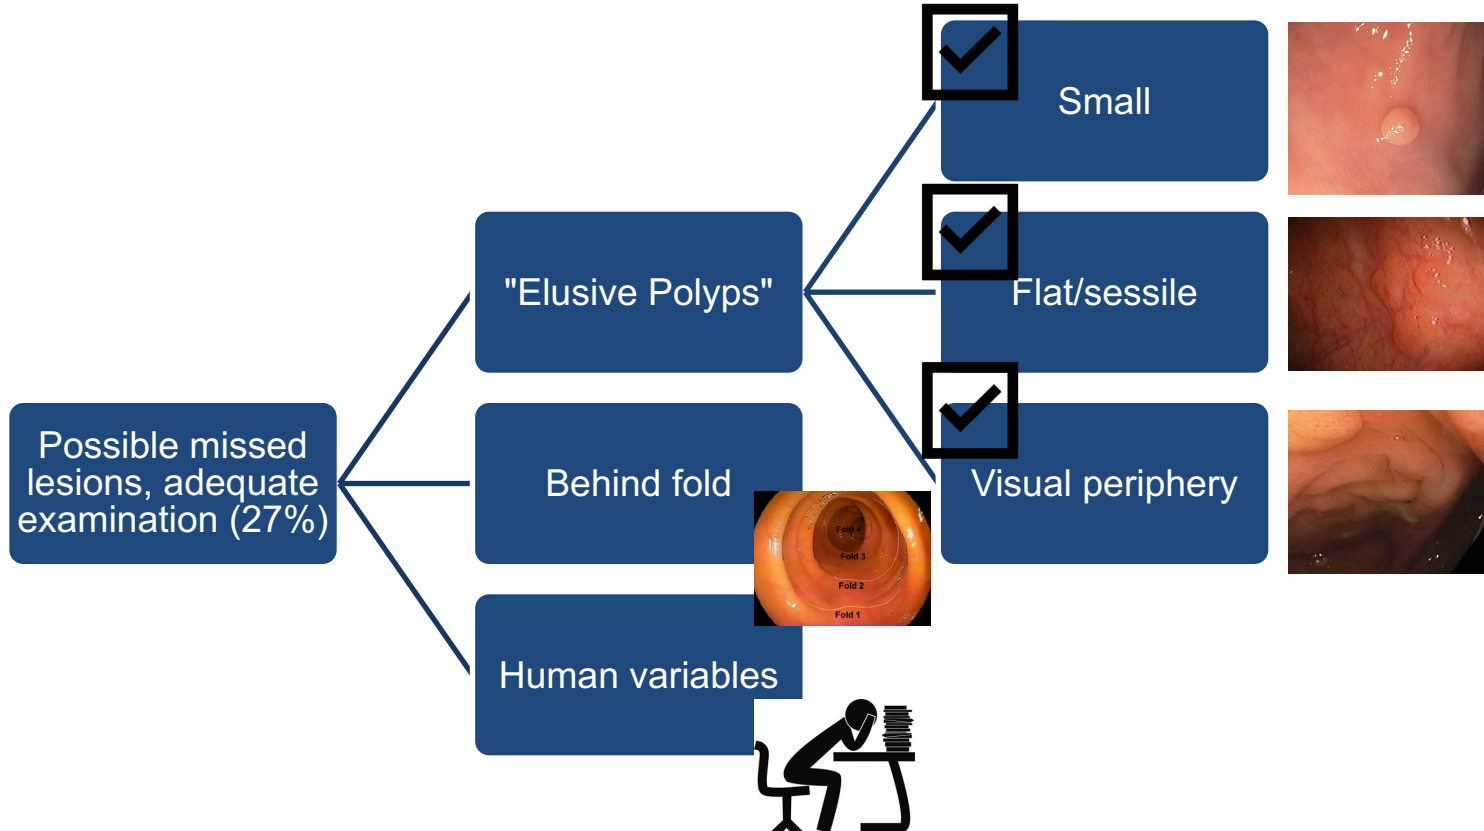

Improve Visualization

- High definition white light imaging + detailed inspection is adequate!
- Chromoendoscopy
 - Indigo Carmine
 - Methylene Blue (+/- oral tablets)
 - Digital
 - Blue laser imaging (BLI)
 - Narrow band imaging (NBI)
 - Linked color imaging (LCI)

Endoscopic Technique

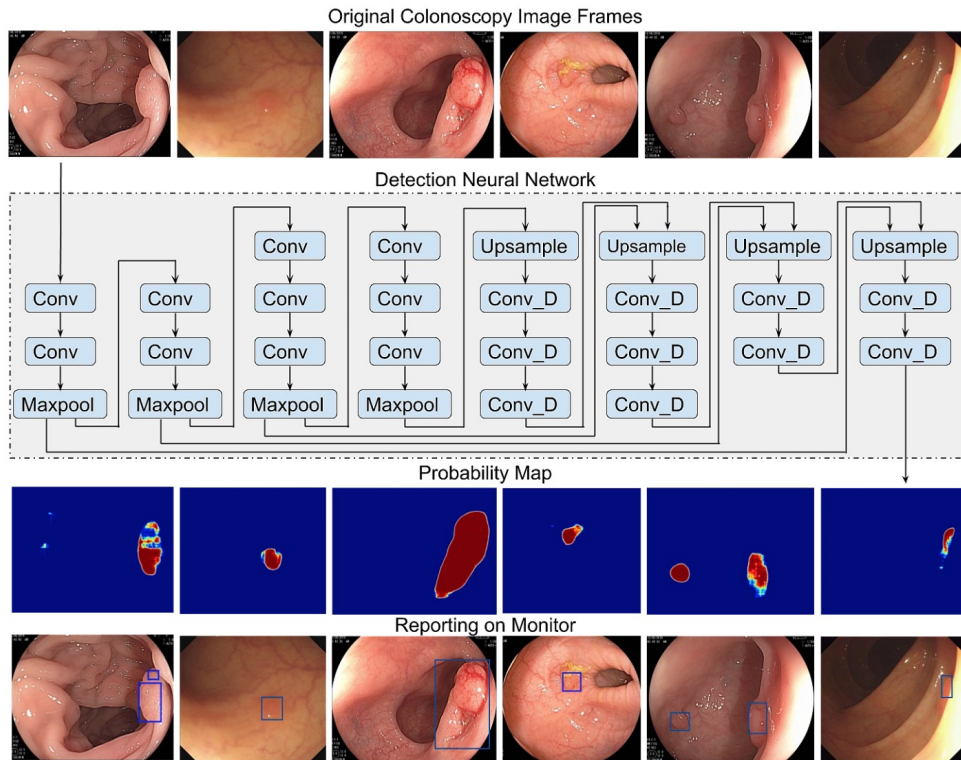

Improve Visualization

Endoscopic Technique

Artificial Intelligence

- AI can provide real time support by recognizing:
 - Polyp patterns
 - Suggesting probable histology
 - Provide confidence level for predicted histology
- Two main areas of research:
 - Polyp detection (CAdE)
 - Polyp classification (CAdx)

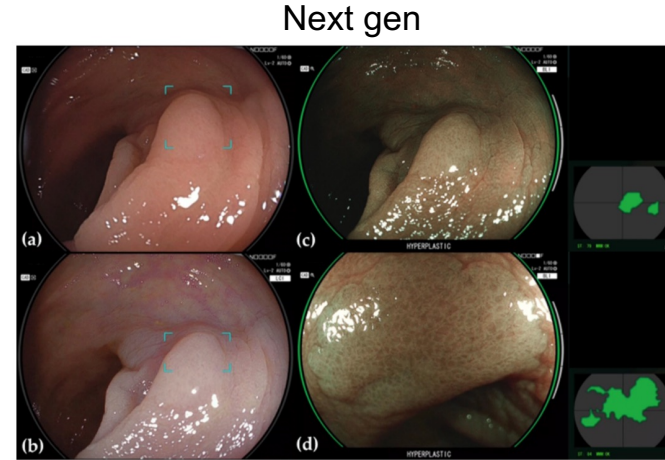

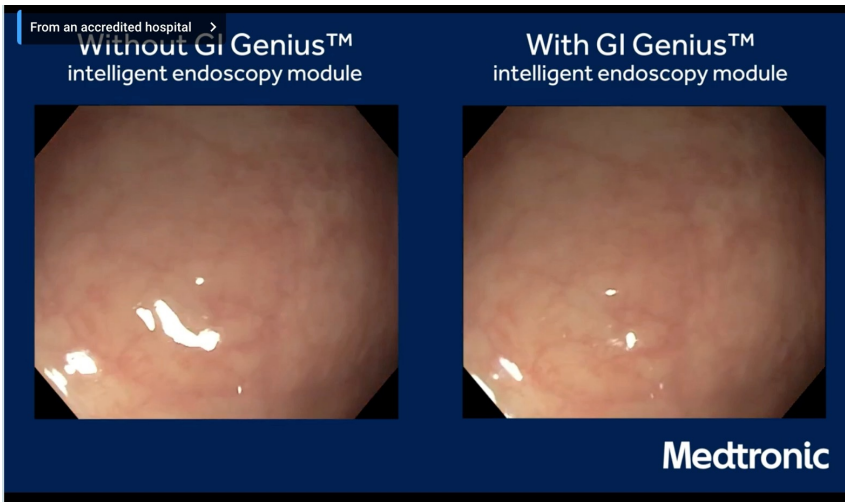

Endoscopic Technique

Artificial Intelligence

CADe

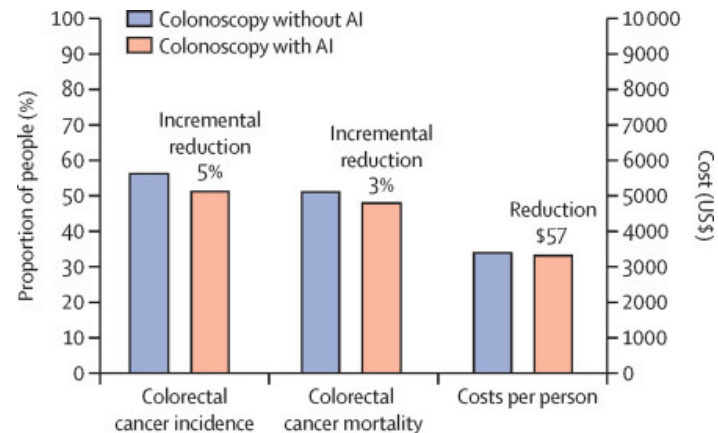

CADe + CADx

Endoscopic Technique

Artificial Intelligence

- AI can increase ADR
 - ADR increased by 6–15.2% depending on investigator's skill and enrollment criteria
 - All randomized RCTs: significant increase in detection rate of small adenomas $\leq 5\text{mm}$
 - One study showed increased detection rate of adenomas 6–9mm
 - No significant differences in withdrawal rates
- Can help determine management through CADx system
 - Tamai et al: 82.9% sensitivity and 82.6% specificity in determining T1b lesions
 - "Resect and discard" or "diagnose and leave"

Endoscopic Technique

Artificial Intelligence

Performance and Attitudes Toward Real-time Computer-aided Polyp Detection during Colonoscopy in a Large Tertiary Referral Center in the United States

Fredy Nehme, MD • Emmanuel Coronel, MD • Denise A. Barringer, MS • ... Mehnaz A. Shafi, MD • William A. Ross, MD • Phillip S. Ge, MD • Show all authors • Show footnotes

Published: February 17, 2023 • DOI: <https://doi.org/10.1016/j.gie.2023.02.016>

CADe was activated in 52.1% of cases

Attitude towards AI: 25% fully embrace, 62.5% “Ok with it”

Potential Concerns regarding AI: 68.8% “too many false positives”

37.5% “unnecessarily prolongs procedure”

25% “too distracting”

12.5% “too expensive”

25.% “will not help ADR enough to be worthwhile”

Endoscopic Unit Support

- Intervention Report Card: endoscopist-specific audit and feedback of colonoscopy performance measures
 - Bowel preparation quality, cecal intubation rate, withdrawal time, PDR and ADR
 - Benchmarked against peers
- Multimodal: didactic lectures on withdrawal technique, visualization and polyp detection
 - +/- hands on component or skills improvement training
- Additional observers: dedicated in room nurse for polyp detection
- Withdrawal time monitoring: nurse recording

Table 2. Impact of Interventions on Colonoscopy Quality-Related Outcomes

Quality improvement interventions	Adenoma detection rate (OR, 95% CI)	Polyp detection rate (OR, 95% CI)	Advanced adenoma detection rate (OR, 95% CI)	Quality of Evidence based on GRADE ¹⁷
Report card	1.28 (1.13–1.45)	1.27 (1.11–1.44)	1.28 (0.93–1.77)	Low
Multimodal	1.18 (1.00–1.40)	1.26 (1.04–1.53)	–	Low
Additional observers	1.25 (1.09–1.43)	–	–	Low
Withdrawal time monitoring	1.35 (0.93–1.96)	1.13 (0.89–1.43)	–	Low

In Summary

1. Multiple factors related to technology, endoscopist and patient that can assist in improving ADR
2. As the patient population who qualify colorectal cancer screening expands, it becomes vitally important we adapt new techniques or technology to combat human fatigue and error
